*Oceans and Oceanography* John P. Rafferty Associate Editor, Earth Sciences 2011-01-15 Constituting more than 70 percent of Earth's surface, the world's oceans are so vast as to remain something of an enigma to this day. Navigating these imposing seas and unlocking their secrets is the calling of oceanographers. Their research helps determine what climatic, geologic, and chemical impact oceans have on a variety of organisms. In spite of their magnitude and might, the world's oceans are not immune to the effects of adverse human activity, such as pollution. This volume surveys this huge, but fragile, ecosystem and the individuals who help fight for the preservation of this vital resource that has critical significance to all earthly life.

*Explore Life* John H. Postlethwait 2003-08 Using a variety of exercise formats (traditional, guided inquiry, and design-your-own), this manual, written by Doreen Schroeder, helps students ask good questions and think critically. Students will analyze data, draw conclusions, and present those conclusions. They will also be challenged to make connections between lab exercises, between lecture and lab, and between biology in the laboratory (or lecture hall) and their own life. Each exercise in the student manual contains an overview, an introduction, a materials list, the methods, and application questions. Where appropriate, time has been built into the exercises for discussion and interactions between students and between students and instructors. The exercises are also adaptable to different situations and time frames. The instructor's manual gives suggestions for adapting the exercises, in addition to a complete supplies list (including some sources), sample lab format, and suggested answers for questions and/or worksheets. **Powerful Ideas of Science and How to Teach Them** Jasper Green 2020-07-19 A bullet dropped and a bullet fired from a gun will reach the ground at the same time. Plants get the majority of their mass from the air around them, not the soil beneath them. A smartphone is made from more elements than you. Every day, science teachers get the opportunity to blow students' minds with counter-intuitive, crazy ideas like these. But

getting students to understand and remember the science that explains these observations is complex. To help, this book explores how to plan and teach science lessons so that students and teachers are thinking about the right things – that is, the scientific ideas themselves. It introduces you to 13 powerful ideas of science that have the ability to transform how young people see themselves and the world around them. Each chapter tells the story of one powerful idea and how to teach it alongside examples and non-examples from biology, chemistry and physics to show what great science teaching might look like and why. Drawing on evidence about how students learn from cognitive science and research from science education, the book takes you on a journey of how

to plan and teach science lessons so students acquire scientific ideas in meaningful ways. Emphasising the important relationship between curriculum, pedagogy and the subject itself, this exciting book will help you teach in a way that captivates and motivates students, allowing them to share in the delight and wonder of the explanatory power of science.
