**Aftershock** John Feffer 2017-11-15 In this unique, panoramic account of faded dreams, journalist John Feffer returns to Eastern Europe a quarter of a century after the fall of communism, to track down hundreds of people he spoke to in the initial atmosphere of optimism as the Iron Curtain fell - from politicians and scholars to trade unionists and grass roots activists. What he discovers makes for fascinating, if sometimes disturbing, reading. From the Polish scholar who left academia to become head of personnel at Ikea to the Hungarian politician who turned his back on liberal politics to join the far-right Jobbik party, Feffer meets a remarkable cast of characters. He finds that years of free-market reforms have failed to deliver prosperity, corruption and organized crime are rampant, while optimism has given way to bitterness and a newly invigorated nationalism. Even so, through talking to the region's many extraordinary activists, Feffer shows that against stiff odds hope remains for the region's future.

**Introduction to Machine Learning** Ethem Alpaydin 2014-08-29 The goal of machine learning is to program computers to use example data or past experience to solve a given problem. Many successful applications of machine learning exist already, including systems that analyze past sales data to predict customer behavior, optimize robot behavior so that a task can be completed using minimum resources, and extract knowledge from bioinformatics data. Introduction to Machine Learning is a comprehensive textbook on the subject, covering a broad array of topics not usually included in introductory machine learning texts. Subjects include supervised learning; Bayesian decision theory; parametric, semi-parametric, and nonparametric methods; multivariate analysis; hidden Markov models; reinforcement learning; kernel machines; graphical models; Bayesian estimation; and statistical testing. Machine learning is rapidly becoming a skill that computer science students must master before graduation. The third edition of Introduction to Machine Learning reflects this shift, with added support for beginners, including selected solutions for exercises and additional example data sets (with code available online). Other substantial changes

include discussions of outlier detection; ranking algorithms for perceptrons and support vector machines; matrix decomposition and spectral methods; distance estimation; new kernel algorithms; deep learning in multilayered perceptrons; and the nonparametric approach to Bayesian methods. All learning algorithms are explained so that students can easily move from the equations in the book to a computer program. The book can be used by both advanced undergraduates and graduate students. It will also be of interest to professionals who are concerned with the application of machine learning methods.
